

## Heritage Farms community solar project

We are hoping to install a 2 Megawatt community solar farm on an unused 5-acre parcel of land located at the Heritage Farms site.

Site map with proposed location:

Community solar is in essence a group-funded solar farm. Ratepayers in Clark PUD's service area will have the chance to subscribe to a select number of panels in the project and have the power generated from those panels be credited to their accounts. This is a concept called Virtual Net Metering. For this specific project, the goal is to have all of the subscribers be low-to-moderate income ratepayers and for the system to produce enough electricity to power 300 homes. We are applying for a grant from the state that will pay for up to \$1 million of the project cost. The remaining funding gap will be provided by solar developers in the community solar space. The project will provide revenue to the Heritage Farm site through leasing fees for the space.
