Clark County Influenza Surveillance Update

CDC Week 50: December 8, 2024 - December 14, 2024

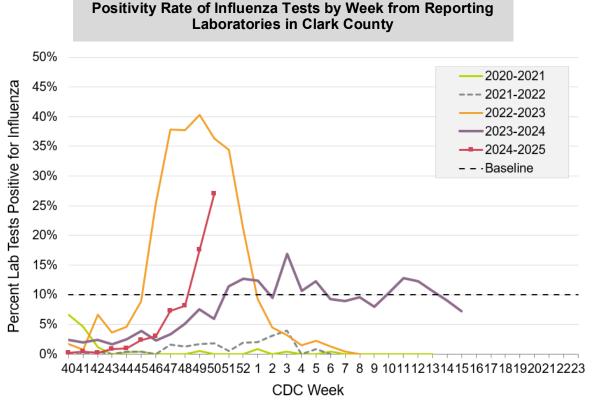

All data are preliminary and may change as more reports are received. As influenza season begins and ends, the number of tests conducted will be smaller than at times of peak activity; therefore, the reliability of positivity figures may decrease as a result.

Summary

- Clark County partner labs reported influenza positivity at 27.0% in Week 50.
- Cowlitz County partner labs reported influenza positivity at 12.7% in Week 50.
- The CDC reported national positivity in Week 50 was at 9.0%.
- Washington State influenza positivity for Week 50 was at 10.3%.

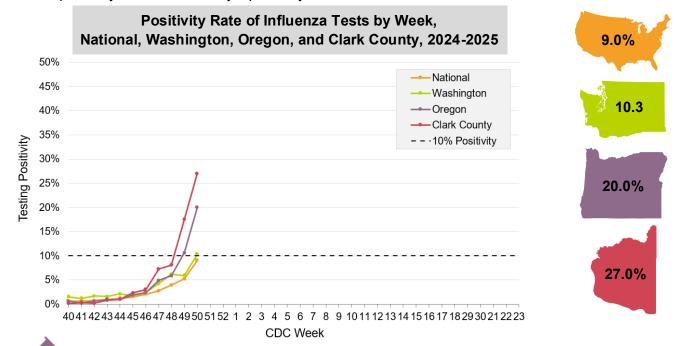

The **influenza positivity rate** is the percent of influenza tests conducted by reporting laboratories that result positive. Traditionally, agencies including the CDC and WA State DOH use positivity ≥10% to define active influenza season.

CDC Week	Date Range	Type A	Type B	Not Typed	Total influenza	Number Tested	Percent Positivity
48	11/24-11/30	23	4	0	27	333	8.11%
49	12/1-12/7	84	3	0	87	496	17.54%
50	12/8-12/14	201	1	0	202	748	27.01%

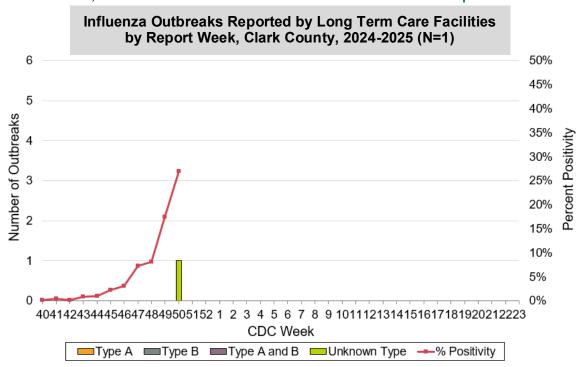

The CDC, Washington State, and Oregon also collect and report influenza activity data on a weekly basis. This allows for comparisons to be made with regional and national trends as the season progresses. In Week 50, the CDC reported national positivity of 9.0%. Washington and Oregon reported positivities of 10.3% and 20.0%, respectively and Clark County's positivity was at 27.0%.

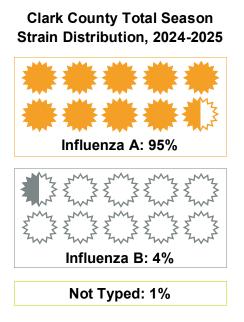

Influenza Outbreaks in Long Term Care Facilities Clark County

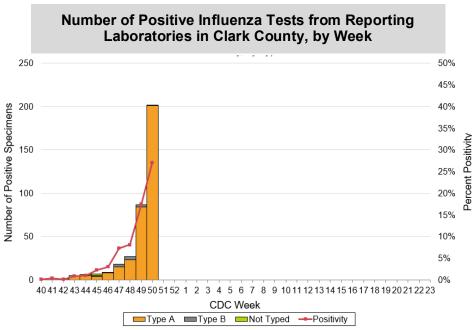

Clark County Public Health identifies and responds to influenza outbreaks in long term care facilities (LTCFs) around Clark County, in order to provide recommendations and guide further community action. So far this influenza season, one lab-confirmed influenza outbreaks have been reported.

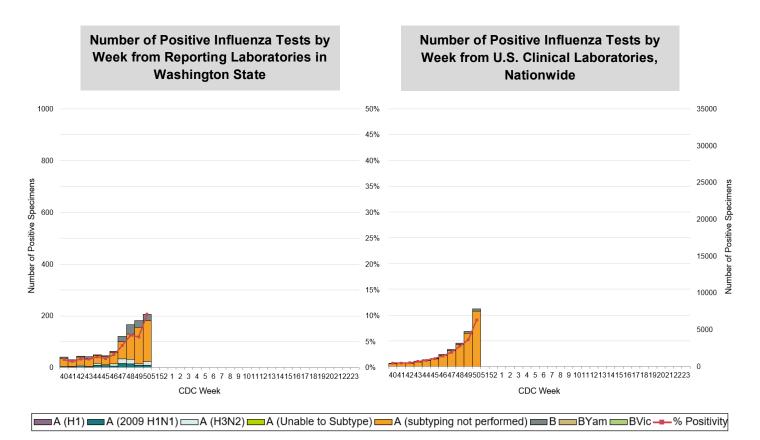

Reporting laboratories also may provide details on what **strains of influenza** are reported positive. The colored bars represent how much of each strain of influenza is being reported, while the red line is the corresponding influenza positivity. The below summaries display the breakdown of influenza strains identified in positive results at the local level, by CDC week. **Through Week 50, 95% of positive influenza tests were identified as influenza A and 4% were identified as influenza B.**

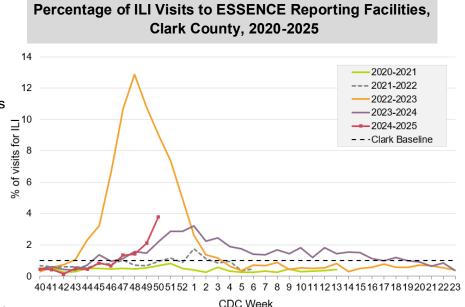

CCPH assesses syndromic surveillance data on influenza-like illness (ILI), in order to view community influenza activity in another way. These data are automatically reported by local hospitals to the CDC's ESSENCE system, and reflect the proportion of individuals seen with ILI symptoms.

The ILI baseline of 1.0% is defined as the mean percent of patient visit for ILI during non-influenza weeks during the previous two seasons, plus two standard deviations.

During Week 50, Clark County ILI visits were at 3.79%, above the county threshold of 1.0%.

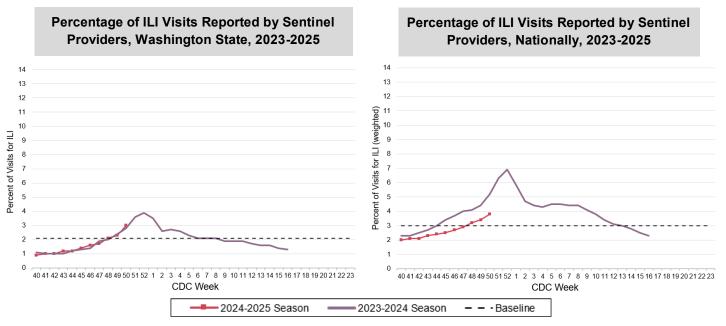

Influenza-Like Illness Visits Reported by Sentinel Providers State and National Data

Sentinel provider data can also provide valuable information on the presence of influenza-like illness (ILI). These data are captured at the state and national level, and are defined as the percent of patient visits to a sentinel healthcare facility that meet the case definition for ILI. ILI is defined as fever ≥ 100° F AND cough and/or sore throat (in the absence of a known cause other than influenza).

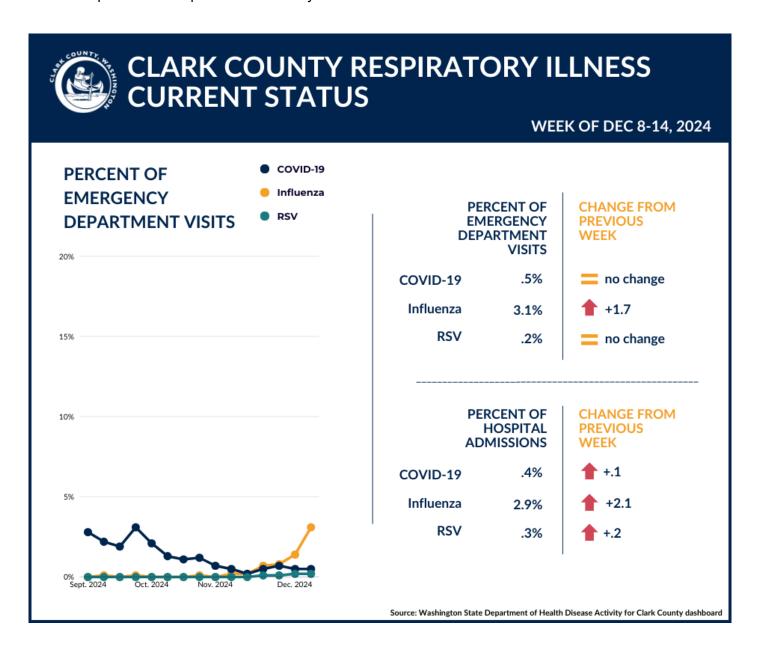

During Week 50, National ILI patient visits were at 3.8%, above the CDC baseline for elevated ILI activity of 3.0%. Washington State data from Week 50 indicated ILI visits were at 3.0%, above the state threshold of 2.1%.

CCPH updates COVID-19, influenza and RSV data each week throughout respiratory illness season using data from the Washington State Department of Health. The following represents respiratory illness activity in Clark County during **Week 50**.

Data points include CDC hospital admission level (low, medium or high), percent of emergency room visits by illness and percent of hospital admissions by illness.

All data is preliminary and may change. For state and regional data visit the Respiratory Illness Data Dashboard.

For additional information on CDC hospital admission levels, visit the CDC COVID Data Tracker.

Cowlitz County Influenza Surveillance Update

CDC Week 50: December 8, 2024 - December 14, 2024

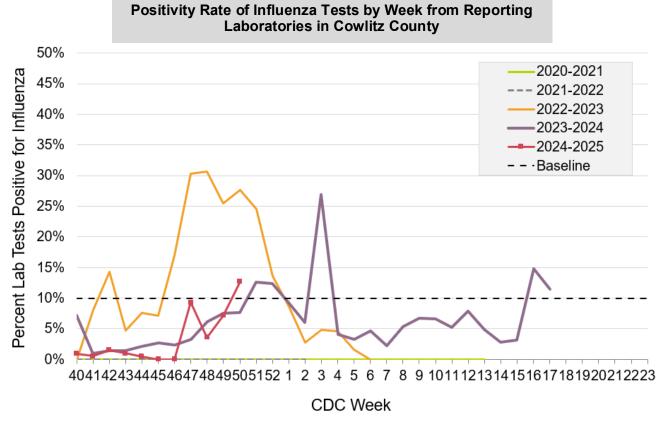

All data are preliminary and may change as more reports are received. As influenza season begins and ends, the number of tests conducted will be smaller than at times of peak activity; therefore, the reliability of positivity figures may decrease as a result.

Cowlitz and Clark Counties are neighboring local health jurisdictions in Washington State.

Although separate entities, both share a common goal of preventing disease and promoting public health. To that end, Cowlitz and Clark County often partner in disease response efforts. This year, Cowlitz and Clark counties will continue working together to provide reliable influenza surveillance data to our communities.

The **influenza positivity rate** is the percent of influenza tests conducted by reporting laboratories that result positive. Traditionally, agencies including the CDC and WA State DOH use positivity ≥10% to define active influenza season.

CDC Week	Date Range	Type A	Type B	Not Typed	Total influenza	Number Tested	Percent Positivity
48	11/24-11/30	0	1	0	1	28	3.57%
49	12/1-12/7	3	1	0	4	56	7.14%
50	12/8-12/14	7	2	0	9	71	12.68%
